# N Tense®

## FOUR MAIN REASONS FOR USING N TENSE WA-

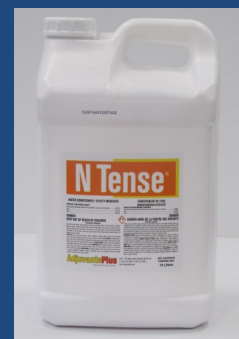

### REASON #1: HARD WATER INACTIVATION

- Calcium, magnesium and iron (and many other metal ions) in spray water (hard water) bind with glyphosate and Glufosinate
- **RESULT:** (Glyphosate-calcium) or (Glufosinate-Calcium) molecule is inactive as a herbicide and not mobile in the plant. Glyphosate / Glufosinate is wasted.
- **N Tense®** Chelates calcium and magnesium (and other ions) preventing glyphosate / glufosinate inactivation.

PPM	WATER CLASSIFICATION
0 – 114	SOFT
114 – 342	MODERATELY HARD
342 – 800	HARD
>800	EXTREMELY HARD

### N Tense water conditioner

- Most active on market
- Patented
- University tested
- Works with many herbicides and all glyphosates including non formulated
- Low use rate:  
(50 to 100 ml in 5 gpa)

### REASON #2: WATER CONDITIONED PERFORMANCE

- Superior control on the widest range of weed species.
- More into weeds: less tied up or inactivated.
- Faster glyphosate absorption: rainfast performance.
- **RESULT:** Improved herbicide performance.

## N Tense®

### REASON #3: TOUGH TO CONTROL WEEDS

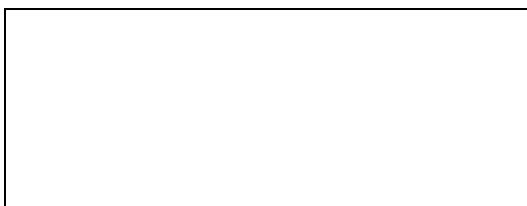

- Some tough weeds contain high levels of calcium and magnesium; example, Common Lambsquarters.
- The inactivating ions in tough weeds are in the wax covering on the leaves as well as in the cells just under the leaf surface.
- **RESULT:** N Tense® will prevent glyphosate from becoming inactivated and immobilized by tough weeds.

### REASON #4: DUST AND DUSTY WEEDS

- Dust created by the sprayer at the time of application or dust blown onto the leaf surface of the weeds acts like Hard Water to inactivate some or most of the glyphosate immediately upon contact.
- **RESULT:** Glyphosate is inactivated; poor performance; inconsistent performance, weed control misses across the field.
- N Tense® prevents or reduces the impact of dust allowing glyphosate to kill weeds.
